

Abstract of the Disclosure

In a system which receives, from different sources, data having various formats, the received data is selected and combined in accordance with the invention to create accurate records. Specifically, the inventive system organizes the received data into uniform data records having a predetermined format. The data in the uniform data records is converted, if necessary, to conform to a predetermined nomenclature, resulting in normalized data records. The normalized data records are grouped into sets of equivalent records. For each set, the inventive system selects relatively accurate data from the equivalent records in the set to create a final record.
